

COVID-19

DISINFECTING - A MOMENT IN TIME

To help avoid the spread of the COVID-19 Virus, GSF-USA has instructed our cleaning crew to increase the disinfecting of touch points and making disinfection a multi-step process.

- ◆ First, using the onsite generated **Multi-Surface cleaner** and a Microfiber cloth, remove soil from any touch surface. This is critical as bacteria lives in the soil.

Decreasing the soil load assists in a more effective “kill” process.

- ◆ Second, using the onsite generated **Disinfectant**, GSF-USA’s crew will spray the previously cleaned surface and allow the product to air dry. This will allow the Disinfectant extended dwell time to increase the kill rate of bacteria.

EPA testing requires a 10-minute dwell time to “kill” the virus.

- ◆ Districts with GSF-USA’s day porters, we will be spraying and wiping common area’s touch points such as drinking fountains, doorknobs, locker handles, etc throughout the day.
- ◆ If needed, GSF-USA will proudly provide supplies for your staff so that we can battle this virus **TOGETHER**.

While disinfecting is a moment in time, it will not stop the spread of COVID-19 if the touch area is contaminated later in the day with bodily fluids that are placed on the surface i.e. coughing, sneezing, saliva etc.

GSF-USA is ready to battle this virus and has purchased extra spray bottles and Micro-Fiber clothes that should be distributed if this epidemic continues.

We ask for your support in this battle, and we are ready to supply your staff with bottles of disinfectant and microfiber clothes to fight together. Our products are 100% safe to use and effective in disinfecting; they should be kept in a place away from children.
